A material's property (or material property) is an intensive property of some material, i.e. a physical property that does not depend on the amount of the material. These quantitative properties may be used as a metric by which the benefits of one material versus another can be compared, thereby aiding in materials selection.. A property may be a constant or may be a function of one or more ...

Electrical conductivity is ability of material to conduct electric current.. The electrical conductivities differ by a factor as large as  $10^{12}$  to  $10^{21}$  between metallic and ceramic materials.. Most of ceramic materials are dielectric (materials, having very low electric conductivity, but supporting electrostatic field).. Electrical conductivity of ceramics varies with the frequency of field ...

In physics and electrical engineering, a conductor is an object or type of material that allows the flow of an electrical current in one or more directions. Materials made of metal are common electrical conductors. Electrical current is generated by the flow of negatively charged electrons, positively charged holes, and positive or negative ions in some cases.
